JavaScript Basics

Introduction

JavaScript is a programming language used to make web pages interactive. It runs in browsers and can also run on servers using Node.js.

Variables

Use let and const to store values. Example: let name = 'Ojas'; const age = 5; Prefer const when the value will not be reassigned.

Data Types

Common types include string, number, boolean, null, undefined, object, and array.

Functions

Functions group reusable code. Example: function add(a, b) { return a + b; }

Conditions

if, else if, and else are used to make decisions based on conditions.

Loops

for and while loops repeat code. Arrays can also be processed with methods such as map, filter, and forEach.

Conclusion

Practice variables, functions, conditions, arrays, and objects to build a strong JavaScript foundation.
