React for Beginners

Introduction

React is a JavaScript library for building user interfaces from reusable components.

Components

A component is a reusable UI unit. Function components are commonly written as JavaScript or TypeScript functions that return JSX.

JSX

JSX lets you write HTML-like syntax inside JavaScript. Example: Hello.

Props

Props pass data from a parent component to a child component.

State

useState lets a component store and update changing data.

Events

React handles events such as onClick and onChange using functions.

Conclusion

Learn components, JSX, props, state, and events before moving to routing and API integration.
